

Time-Varying Mixed Graphical Models

Jonas Haslbeck and Lourens Waldorp

*Psychosystems lab
University of Amsterdam, the Netherlands*

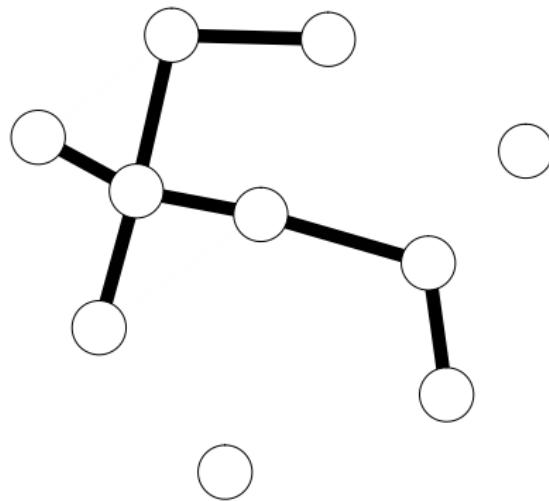

Psychoco Workshop 2017

Multivariate System: Patient

Symptoms and contextual variables

Multivariate System: Patient

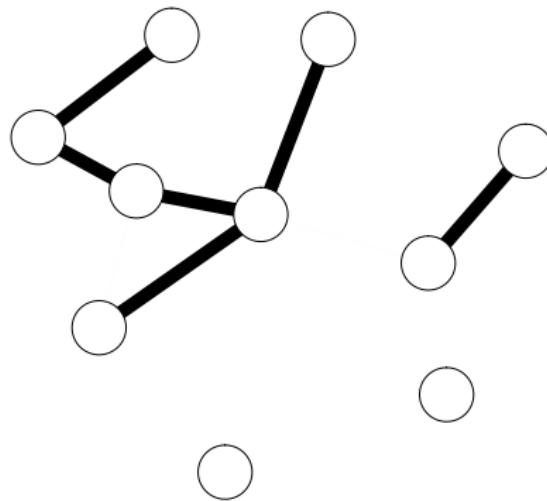

Possibly very complicated interactions

Multivariate System: Patient

All parameters can change over time

Goal: Approximate Multivariate System

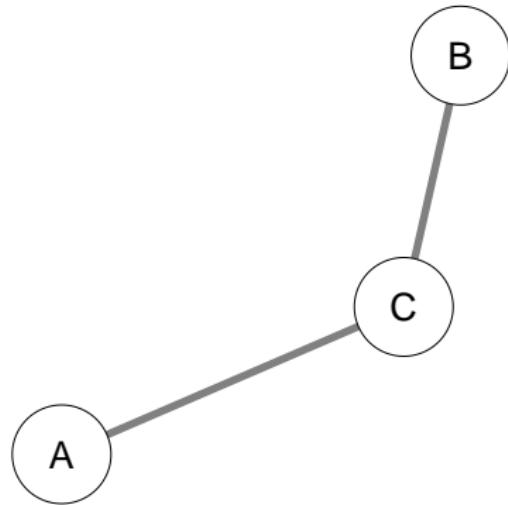

... using time-varying Mixed Graphical Models

What are Graphical Models?

$$X_A \perp\!\!\!\perp X_B | X_C$$

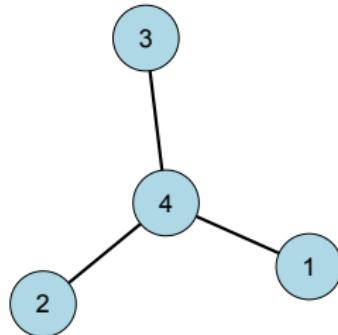

$$X_A \not\perp\!\!\!\perp X_C | X_B \quad \iff$$

$$X_C \not\perp\!\!\!\perp X_B | X_A$$

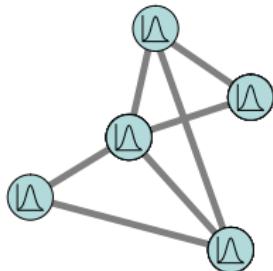

Example: Gaussian Graphical Model

$$\Sigma^{-1} = \begin{matrix} & \begin{matrix} X_1 & X_2 & X_3 & X_4 \end{matrix} \\ \begin{matrix} X_1 \\ X_2 \\ X_3 \\ X_4 \end{matrix} & \begin{pmatrix} 3.45 & 0 & 0 & 3.18 \\ 0 & 2.14 & 0 & 0.82 \\ 0 & 0 & 3.21 & 1.05 \\ 3.18 & 0.82 & 1.05 & 8.77 \end{pmatrix} \end{matrix} \iff$$

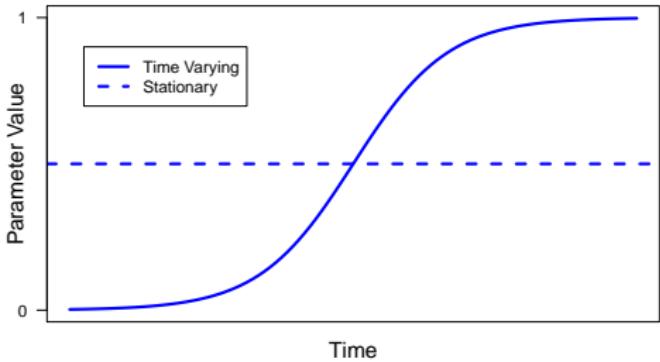

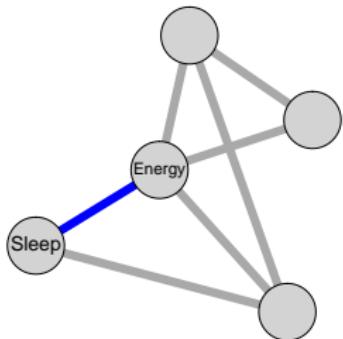

$$P(X_1, \dots, X_p) = \frac{1}{\sqrt{(2\pi)^p |\Sigma|}} \exp \left\{ -\frac{1}{2} (\mathbf{x} - \boldsymbol{\mu})^\top \Sigma^{-1} (\mathbf{x} - \boldsymbol{\mu}) \right\}$$

Time-invariant Graphical Model

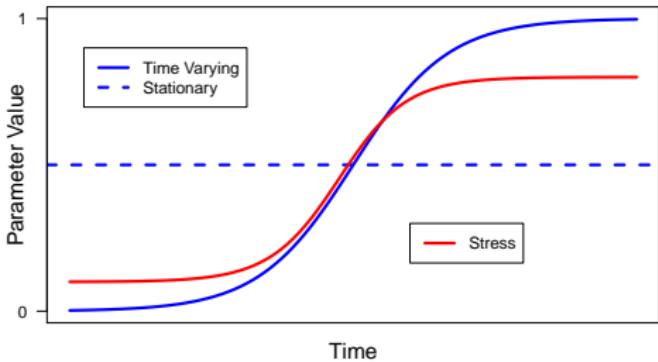

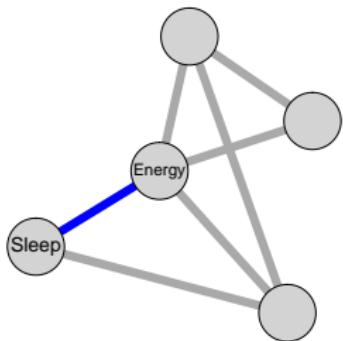

$$\begin{array}{l} \text{Time} \\ \hline \begin{array}{c} 1 \\ 2 \\ \vdots \\ T-1 \\ T \end{array} \end{array} \begin{pmatrix} X_1 & X_2 & X_3 & X_4 & X_5 \\ 3.45 & 1 & 0.98 & 3 & 1 \\ 1.11 & 3 & 0.82 & 3 & 2 \\ \vdots & \vdots & \vdots & \vdots & \vdots \\ 0.12 & 2 & 0.71 & 2 & 2 \\ -0.78 & 1 & 0.18 & 1 & 1 \end{pmatrix}$$

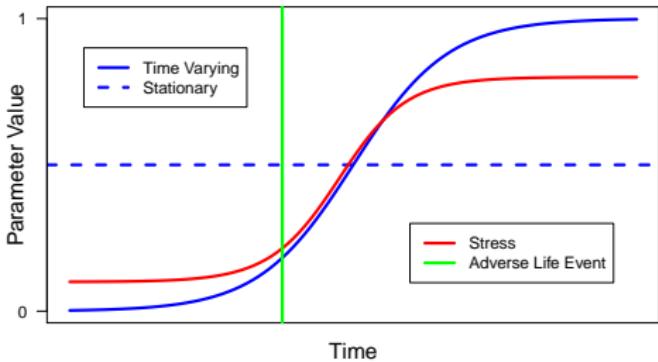

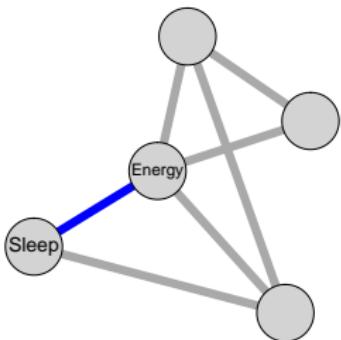

Parameters may change over time!

Parameters may change over time!

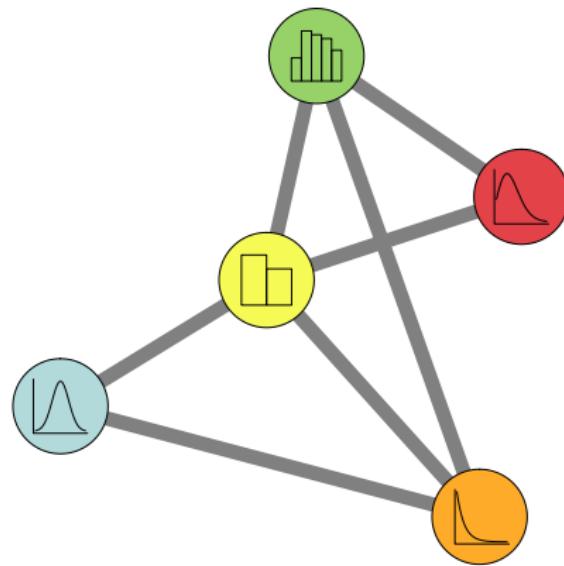

Parameters may change over time!

Introducing time-varying Mixed Graphical Models

- 1) Stationary Mixed Graphical Models
- 2) Extension to the time-varying case

Mixed Exponential Graphical Model

Construction of Mixed Exponential Graphical Model

Conditional univariate members of the exponential family

$$P(X_s|X_{\setminus s}) = \exp \{ E_s(X_{\setminus s})\phi_s(X_s) + C_s(X_s) - \Phi(X_{\setminus s}) \},$$

factorize to a global multivariate distribution which factors according the graph defined by the node-neighborhoods if and only if $E_s(X_{\setminus s})$ has the form:

$$\theta_s + \sum_{t \in N(s)} \theta_{st} \phi_t(X_t) + \dots + \sum_{t_2, \dots, t_k \in N(s)} \theta_{t_2, \dots, t_k} \prod_{j=2}^k \phi_{t_j}(X_{t_j})$$

(Yang et al., 2014)

Construction of Mixed Exponential Graphical Model

Conditional univariate members of the exponential family

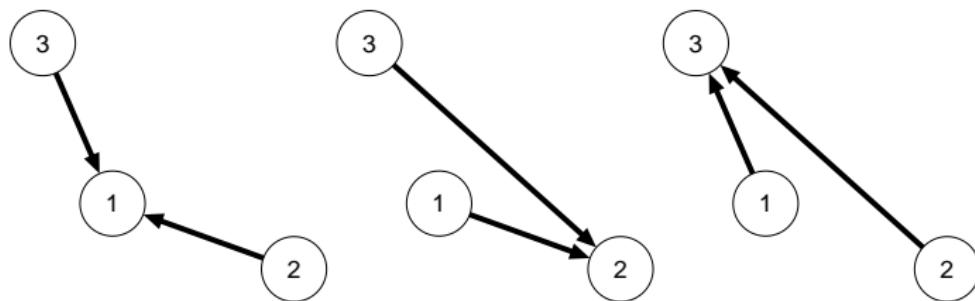

$$P(X_s|X_{\setminus s}) = \exp \{ E_s(X_{\setminus s})\phi_s(X_s) + C_s(X_s) - \Phi(X_{\setminus s}) \},$$

factorize to a global multivariate distribution which factors according the graph defined by the node-neighborhoods if and only if $E_s(X_{\setminus s})$ has the form:

$$\theta_s + \sum_{t \in N(s)} \theta_{st} \phi_t(X_t) + \dots + \sum_{t_2, \dots, t_k \in N(s)} \theta_{t_2, \dots, t_k} \prod_{j=2}^k \phi_{t_j}(X_{t_j})$$

(Yang et al., 2014)

Neighborhood Regression Method

(Meinshausen & Bühlmann, 2006)

Estimation Algorithm

For each node s :

1. Regress $X_{\setminus s}$ on X_s

- ▶ $\min_{(\theta_0, \theta) \in \mathbb{R}^p} \left[\frac{1}{N} \sum_{i=1}^N (y_i - \theta_0 - X_{\setminus s; i}^T \theta)^2 + \lambda_n \|\theta\|_1 \right]$
- ▶ Select λ_n using EBIC

2. Threshold Parameter Estimates

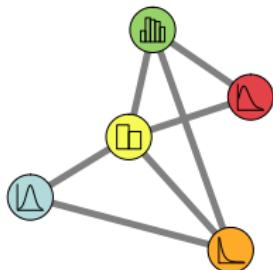

- ▶ $\tau_n \asymp \sqrt{d} \|\theta\|_2 \sqrt{\frac{\log p}{n}}$

Combine Estimates from both regressions

- ▶ AND-rule: Edge present if both parameters are nonzero
- ▶ OR-rule: Edge present if at least one parameter is nonzero

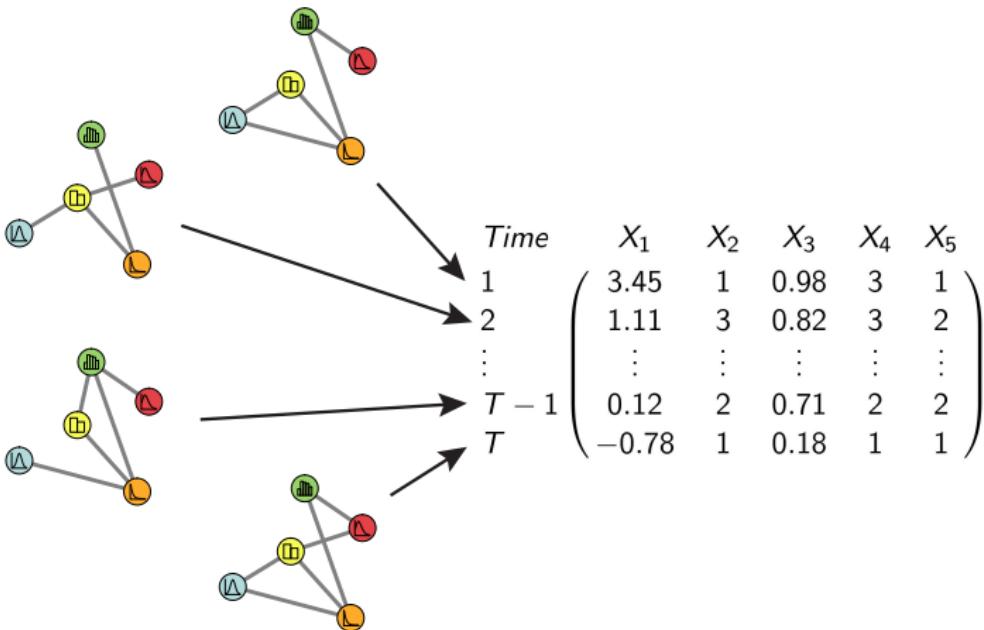

(Loh & Wainwright, 2013)

Recap: Time-**in**variant mixed Graphical Model

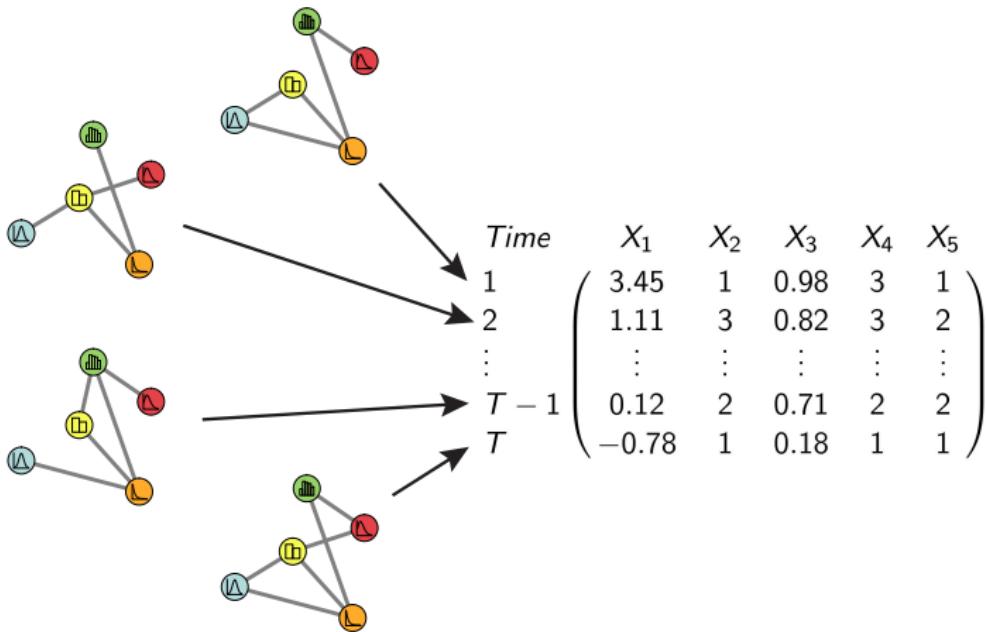

$$\begin{array}{l} \text{Time} \\ \hline \begin{array}{c} 1 \\ 2 \\ \vdots \\ T-1 \\ T \end{array} \end{array} \begin{pmatrix} X_1 & X_2 & X_3 & X_4 & X_5 \\ 3.45 & 1 & 0.98 & 3 & 1 \\ 1.11 & 3 & 0.82 & 3 & 2 \\ \vdots & \vdots & \vdots & \vdots & \vdots \\ 0.12 & 2 & 0.71 & 2 & 2 \\ -0.78 & 1 & 0.18 & 1 & 1 \end{pmatrix}$$

Time-varying mixed Graphical Model

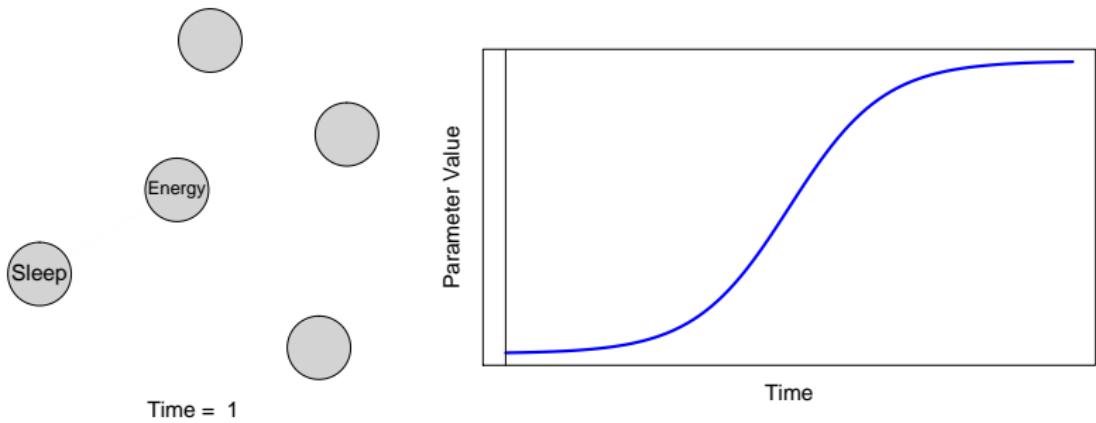

Time-varying mixed Graphical Model

But: we have the scaling $\tau_n \asymp \sqrt{d} \|\theta\|_2 \sqrt{\frac{\log p}{n}}$

Local Stationarity

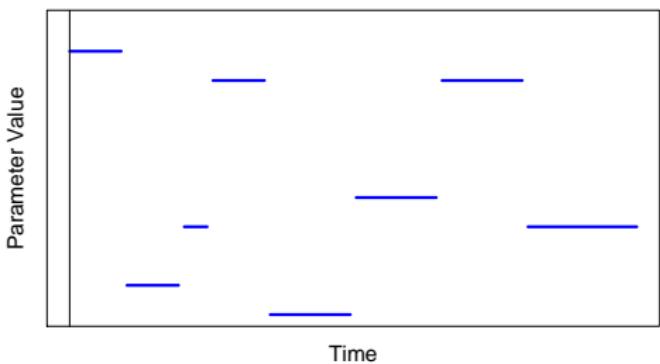

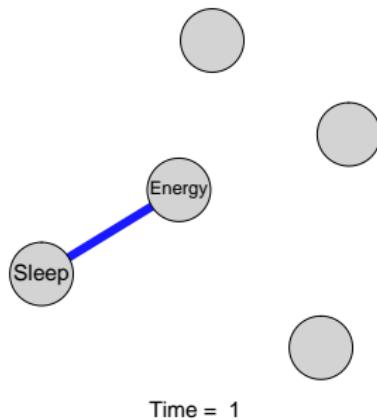

Assumption: Edge parameters are a smooth function of time

Local Stationarity

Assumption: Edge parameters are a smooth function of time

Local Stationarity Violated!

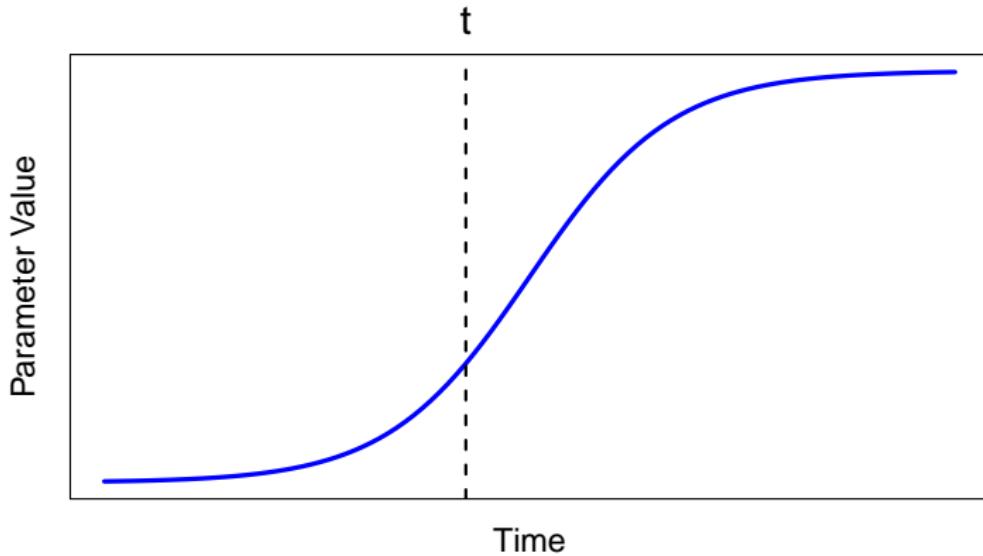

Edge parameters are *not* a smooth function of time!

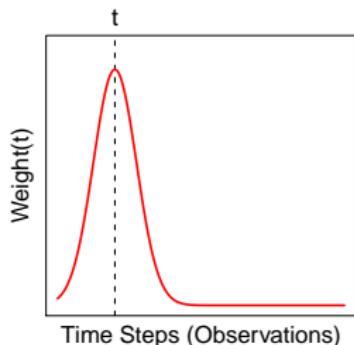

Local Stationarity Violated!

Edge parameters are *not* a smooth function of time!

Again: Local Stationarity

Time-varying Graphs via Weighted Regression

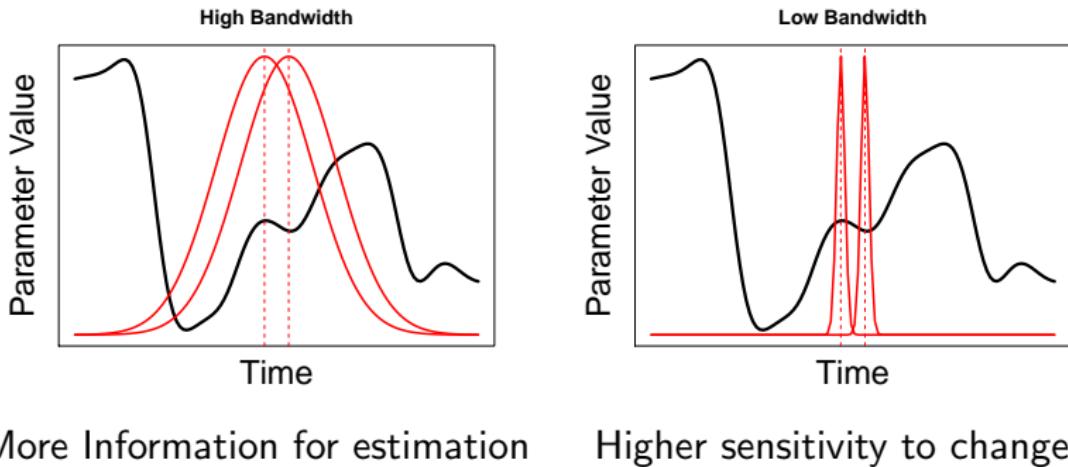

Time	X_1	...	X_5	$Weight(t)$
1	0.92	...	-1.47	0
2	0.78	...	-0.48	0.13
3	0.07	...	0.42	0.60
4	-1.99	...	1.36	1.00
5	0.62	...	-0.10	0.60
6	-0.06	...	0.39	0.13
7	-0.21	...	0.99	0
:	:	:	:	:
T	-0.16	...	0.18	0

Weighted cost function:

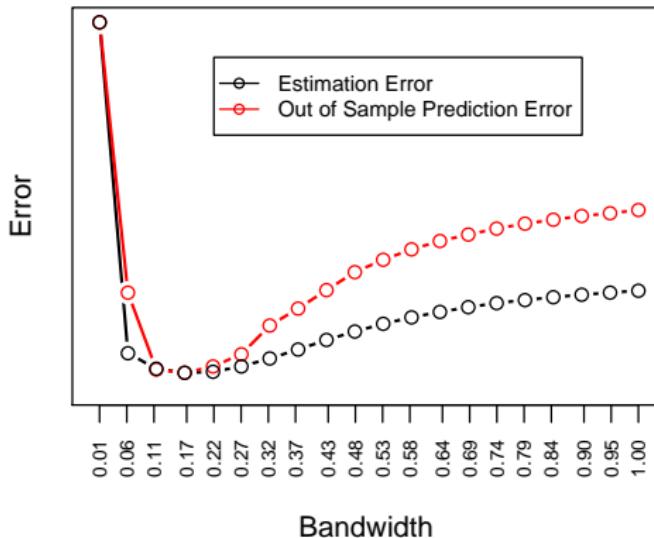

$$\min_{(\theta_0, \theta) \in \mathbb{R}^p} \left[\frac{1}{N} \sum_{i=1}^N \textcolor{red}{w_{i;t}} (y_{i;t} - \theta_{0;t} - X_{\setminus s;i}^T \theta_t)^2 + \lambda_n \|\theta_t\|_1 \right]$$

What is the right bandwidth?

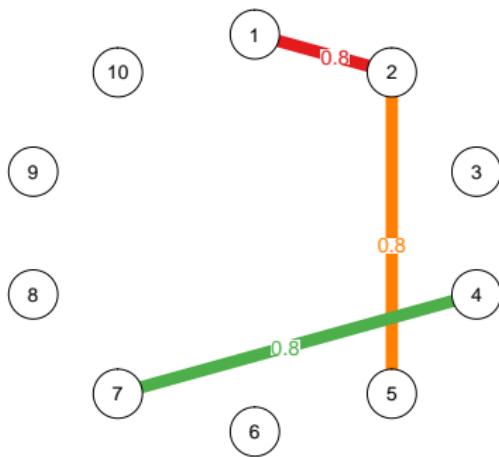

$$\text{Scaling: } \tau_n \asymp \sqrt{d} \|\theta\|_2 \sqrt{\frac{\log p}{n}}$$

Data driven bandwidth selection

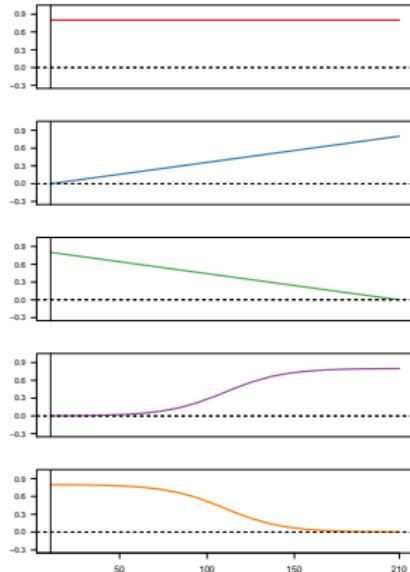

True Model: 6 variables, 4 time-varying parameters, $N = 1000$

Small Simulation: Typical ESM Data

Time = 1

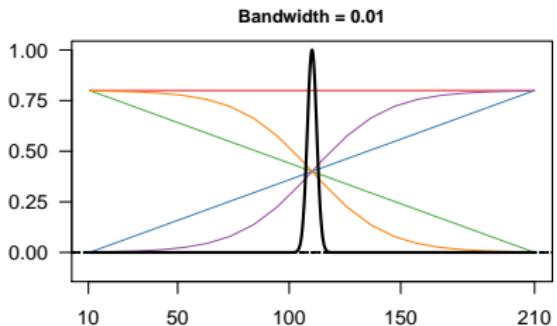

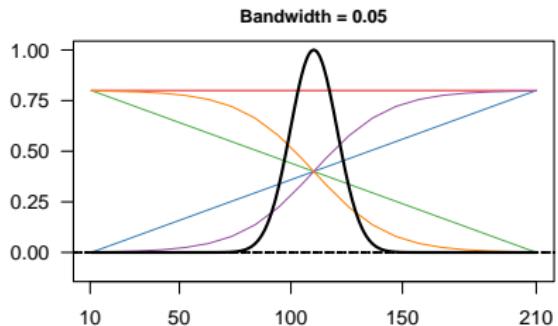

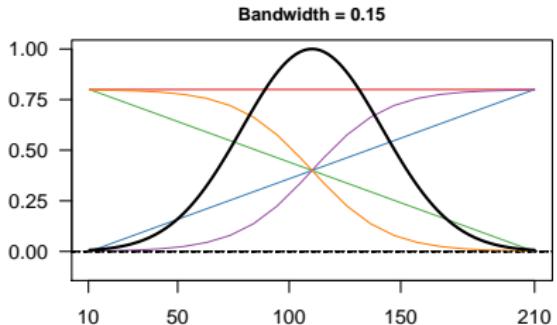

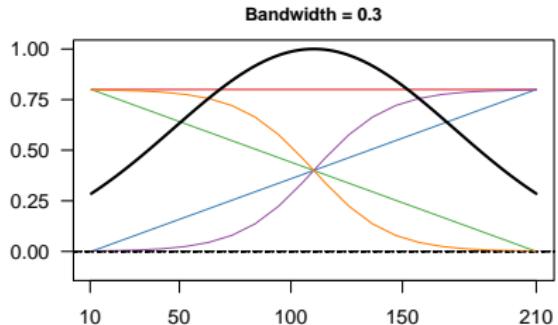

10 measurements/day \times 3 weeks = 210

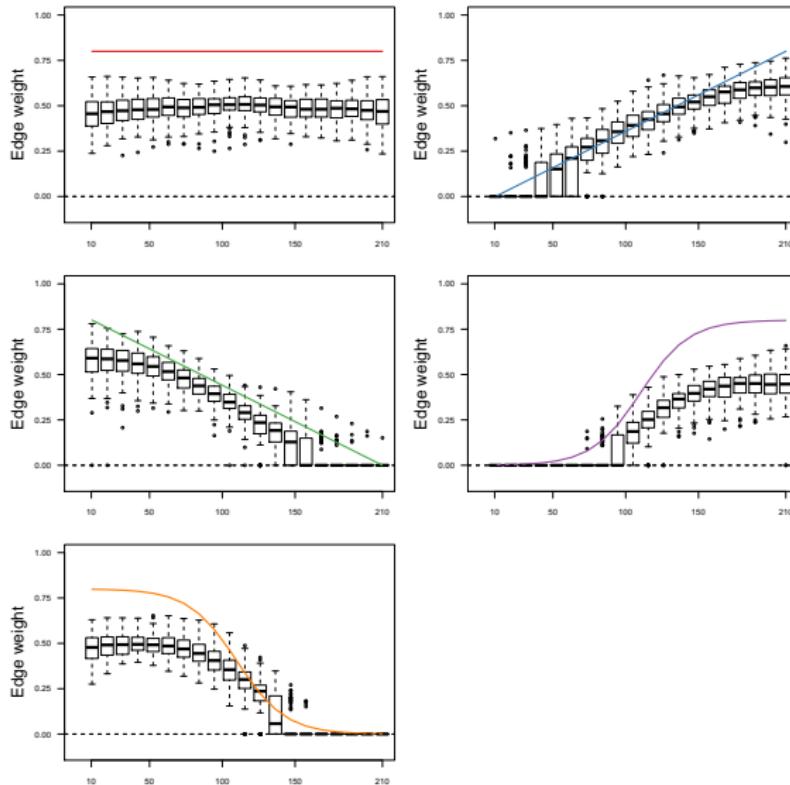

Small Simulation: Typical ESM Data

$$10 \text{ measurements/day} \times 3 \text{ weeks} = 210$$

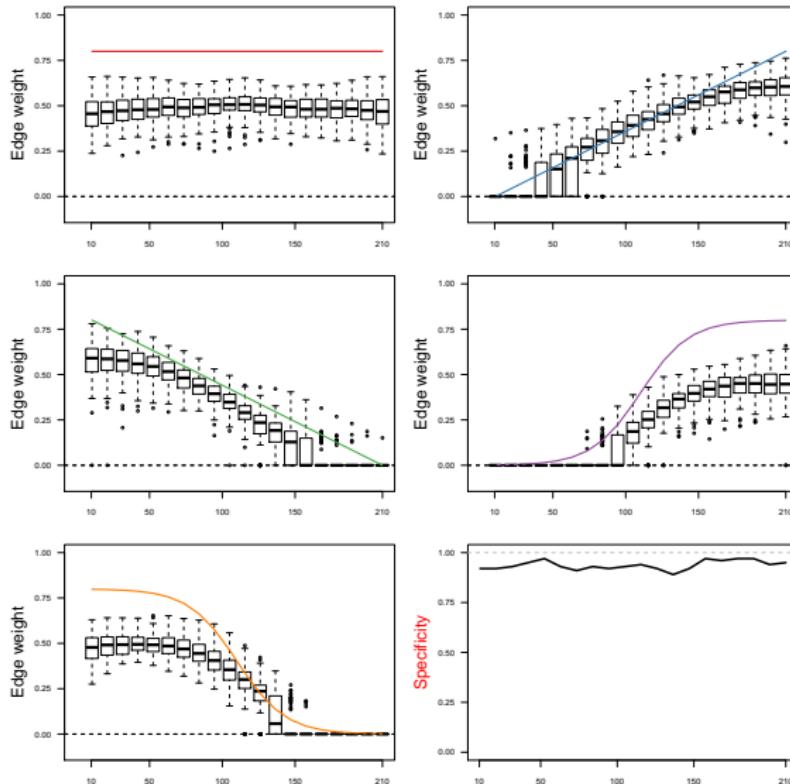

Typical ESM Data: Select Bandwidth

Small Simulation: Results

Small Simulation: Results

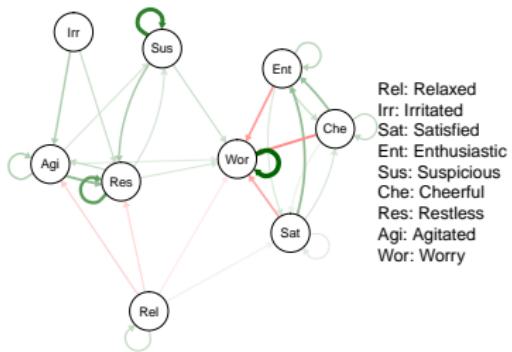

Application to Event Sampling Data

The image shows a mobile application interface for data collection. The main screen displays a question: "How do you feel?". Below the question are three categorical options: "Good", "Neutral", and "Bad". A horizontal slider is positioned between "Good" and "Bad", with the value "5" marked in the center. To the right of the slider is a "Next" button. Below the slider is a numeric keypad. The numeric keypad includes a numeric row (1-9, 0, .), a row with symbols like #, *, and a row with additional symbols like !, @, &. Below the numeric keypad are buttons for "123", "space", and "return".

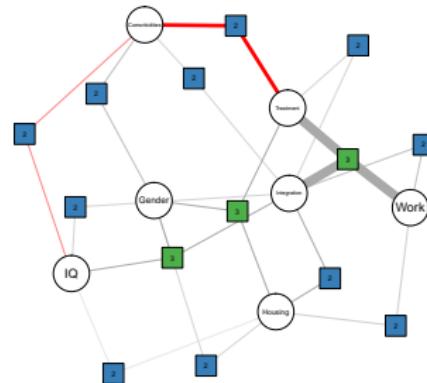

- ▶ Time series of 1 person
- ▶ 43 variables (continuous & categorical)
- ▶ Up to 10 measurements a day
- ▶ For 36 weeks

Time-varying Graph of Psychopathology

Additional Features

mixed VAR models

k order MGMS

Time-varying Mixed Graphical Models

Summary

- ▶ Time varying model under assumption of local stationarity
- ▶ Allows for mixed variables (e.g. categorical and continuous)
- ▶ Scales well for large p and allows for $p > n$
- ▶ Works in realistic situations
- ▶ Also time-varying mixed VAR models implemented
- ▶ Available via R-package *mgm* on CRAN
